

ABSTRACT OF THE DISCLOSURE

A food package storage and dispensing container having a top, bottom and sides. At least one side has a structure defining a potential dispensing opening. The opening includes an openable line defining a downwardly extending U-shaped path. The opening of the container is provided along the openable line in which a flap is formed that turns about a transverse line thereabove. In the absence of an object passing through the opening, the flap naturally turns about the transverse line to extend generally downwardly to generally cover the opening.
